PRESS RELEASE

November 2017

UK DRONE COMPANY INTRODUCES NEXT GENERATION END-TO-END DRONE SOLUTION FOR AGRICULTURE

UK based DroneAG is the first in the world to market the latest generation M200 Agri Pro drone integrated with the latest generation Slanrange 3p agri sensor.

Weatherproof and long-ranging with on-board, network-free, speedy data processing, the new system will have worldwide agricultural applications, particularly effective for R and D, trials and monitoring high value crops.

The exciting new set-up was developed and tested by DroneAG at their farm estate base where they offer agri-specific training with the new system package, creating a full end-to-end solution.

“This system combines the best-in-class DJI M200 drone and highly effective 3p multispectral sensor from Slanrange ” says DroneAG’s Jack Wrangham. “The industrial spec system can operate in more adverse environments than ever before, producing more of the most accurate data than before, in a shorter time - and process that data without an internet connection.”

“The UK weather won’t be such an issue with this system, “ said Jack. “and the information is quickly and easily obtained so data can be acted upon straight away.”

Ends.
